

MVG – Project Manifesto

According to the latest publication of the [United Nations Declaration of Human Rights](#), there is [no human right to financial transparency](#), and as a result has led to an epidemic of financial deception and irresponsibility in many aspects of digital economics in the past, present and foreseeable future...until now.

Due to the (intended or unintended) lack of recognition of this vital issue, deception is becoming a rapidly evolving industry in the digital age. Deceptive or falsely advertised financial services & investments are not only unregulated and extremely loosely controlled in [both thriving and contracting economies](#), but are incentivised to continue growing at an alarming and uncontrollable rate, at the expense of investors around the globe.

The ultimate result of an unregulated industries growth, is unethical administrators of extremely high risk investment funds continually creating unregulated funds at no legal cost to acquire quick wealth at the direct cost of uninformed investors. Since there is absolutely no global effort that aims to regulate these kind of extremely high risk investments, many new investors from countries where financial investments & services are loosely or not at all regulated are deceived or misled into mistaking these high-risk financial investments as legitimate or stable investment opportunities.

MVG proposes a solution to convert this highly unregulated, unethical and blatantly unfair market, into an economically prosperous tool for investors and legitimate enterprises alike, to end the total deception of investors and to prevent it from possibly out-breaking to the state we find ourselves in today, ever again.

An attempt at this goal was briefly initiated during 2017-2018, with the extremely rapid growth of concepts and projects using Crowdfunding & Initial Coin Offerings (ICOs) for cryptocurrency projects, offering an easier to access & innovative form of investment, though one key element was overlooked. Investors in ICOs have absolutely no control over the movement of raised funds, opening the door to [widespread deception and financial detriment to investors](#). Due to this, a would-have-been outstanding advancement of crowdfunding technology was quickly abused by illegitimate project administrators, preventing potentially revolutionary technology from taking off.

This has left many new legitimate projects looking to use the ICO technology infrastructure at a road block, left to deal with heavy and harsh imposed regulations, while illegitimate projects inconsiderate of regulation, continue to deceive and mislead to acquire quick wealth at the cost of insufficiently educated or ill-informed investors, slowly taking the same declining direction as the aforementioned financial investment sector.

MVG not only proposes fix the quite clearly broken financial investment sector, but additionally greatly improve the new & innovating concepts of crowd-funding and initial coin offerings by creating consensus-based, decentralized and transparent technology operated by enterprises, though controlled by investors.

MVG – Project Manifesto

This presumably ambitious goal has been formulated and calculated for over 2 years and recently deemed achievable by the team of MVG, by creating three vital components to ultimately forever supersede the ICOs Financial Investment & Crowdfunding sectors by fusing each concept into a completely transparent, economically prosperous & eventually open-source investment framework

This framework, to be known as Token Distribution Investment Platform (TDIP) Technology, is capable of fusing scalable financial investments, tokenised coin offerings & crowdfunding opportunities from the very first development. Eventually to be available in a free and open-source bundle for enterprises, the continued development of TDIP technology will serve as an innovative and sustainable development model for enterprises seeking to operate anything from a start-up or crowdfunding concept to a long term financial venture, such as an investment or mutual fund, in a completely (and forcefully) transparent manner.

Pairing TDIP technology with AMP (Automated Monitoring Platform) technology, the second technological component of our development plan, will allow the real-time transparency monitoring of all active enterprises using TDIP technology. This allows investors to monitor every enterprise using the TDIP technology framework and easily determine the most profitable, viable or interesting venture, in turn creating growing competitiveness between platforms. By allowing anyone in the public to operate an AMP, bonuses can be offered to participate in featured or outstanding projects in return for affiliate use, adding increased incentive to use TDIP technology-based ventures over other superseded infrastructures and offering further bonus to investors on top of the interest offered by the platform.

The final step toward our three-part development plan is the creation of MVG's native blockchain protocol, dubbed the "EBW" (Everybody Wins) protocol, an even further advancement creating a completely decentralised investment facilitating blockchain infrastructure. The "Everybody Wins" protocol is a self-governing consensus-based blockchain protocol based on Smart Contract technology, to enable a completely self-managed, autonomous and secure crowdfunding and investment models for token offerings. Using the EBW protocol, new enterprises are able to offer predetermined interest to investors who fund their tokenized concept or idea while giving complete peace of mind and fair rewarding/distribution to investors while development is underway. The EBW protocol will be the first blockchain environment of its kind to allow enterprises to setup crowdfunding or investment ventures instantly, while giving investors complete control over the movement of their investment.

Moving forward with the first public release and continued development will require very little funding in comparison to most crowdfunding ventures, setting a positive example for enterprises who choose to use our technology in the future. The concept has already been in formulation for over 24 months & the first version of TDIP technology itself has in development for over 18 months. The level of experience and expertise of the MVG team in each targeted industry as well as the time spent on building the project before public release places MVG in the ranks of the top 50 crypto currencies in terms of work completed and project progression. Ultimately, this greatly increases the speed of growth and reduces the costs required to continue development, toward what will be one of the most revolutionary technological developments in the blockchain field.
